## 1.1. Contest

### 1.1.1. Makefile

```
.PRECIOUS: ./p%

%: p%
  ulimit -s unlimited && ./$<
p%: p%.cpp
  g++ -o $@ $< -std=c++17 -Wall -Wextra -Wshadow \
    -fsanitize=address,undefined
```

## 1.2. How Did We Get Here?

### 1.2.1. Macros

Use vectorizations and math optimizations at your own peril.
For gcc≥9, there are `[[likely]]` and `[[unlikely]]` attributes.
Call gcc with `-fopt-info-optimized-missed-optall` for optimization info.

```
#define _GLIBCXX_DEBUG           1 // for debug mode
#define _GLIBCXX_SANITIZE_VECTOR 1 // for asan on vectors
#pragma GCC optimize("O3", "unroll-loops")
#pragma GCC optimize("fast-math")
#pragma GCC target("avx,avx2,abm,bmi,bmi2") // tip: `lscpu`
// before a loop
#pragma GCC unroll 16 // 0 or 1 -> no unrolling
#pragma GCC ivdep
```

### 1.2.2. Fast I/O

```
struct scanner {
  static constexpr size_t LEN = 32 << 20;
  char *buf, *buf_ptr, *buf_end;
  scanner()
      : buf(new char[LEN]), buf_ptr(buf + LEN),
        buf_end(buf + LEN) {}
  ~scanner() { delete[] buf; }
  char getc() {
    if (buf_ptr == buf_end) [[unlikely]]
      buf_end = buf + fread_unlocked(buf, 1, LEN, stdin),
      buf_ptr = buf;
    return *(buf_ptr++);
  }
  char seek(char del) {
    char c;
    while ((c = getc()) < del) {}
    return c;
  }
  void read(int &t) {
    bool neg = false;
    char c = seek('-');
    if (c == '-') neg = true, t = 0;
    else t = c ^ '0';
    while ((c = getc()) >= '0') t = t * 10 + (c ^ '0');
    if (neg) t = -t;
  }
};
struct printer {
  static constexpr size_t CPI = 21, LEN = 32 << 20;
  char *buf, *buf_ptr, *buf_end, *tbuf;
  char *int_buf, *int_buf_end;
  printer()
      : buf(new char[LEN]), buf_ptr(buf),
        buf_end(buf + LEN), int_buf(new char[CPI + 1]()),
        int_buf_end(int_buf + CPI - 1) {}
  ~printer() {
    flush();
    delete[] buf, delete[] int_buf;
  }
  void flush() {
    fwrite_unlocked(buf, 1, buf_ptr - buf, stdout);
    buf_ptr = buf;
  }
  void write_(const char &c) {
    *buf_ptr = c;
    if (++buf_ptr == buf_end) [[unlikely]]
      flush();
  }
  void write_(const char *s) {
    for (; *s != '\0'; ++s) write_(*s);
  }
  void write(int x) {
    if (x < 0) write_('-'), x = -x;
    if (x == 0) [[unlikely]]
      return write_('0');
    for (tbuf = int_buf_end; x != 0; --tbuf, x /= 10)
      *tbuf = '0' + char(x % 10);

### Kotlin

```
import java.io.*
import java.util.*

@JvmField val cin = System.`in`.bufferedReader()
@JvmField val cout = PrintWriter(System.out, false)
@JvmField var tokenizer: StringTokenizer = StringTokenizer("")
fun nextLine() = cin.readLine()!!
fun read(): String {
  while(!tokenizer.hasMoreTokens())
    tokenizer = StringTokenizer(nextLine())
  return tokenizer.nextToken()
}

// example
fun main() {
  val n = read().toInt()
  val a = DoubleArray(n) { read().toDouble() }
  cout.println("omg hi")
  cout.flush()
}
```

### 1.2.3. constexpr

Some default limits in gcc (7.x - trunk):

- constexpr recursion depth: 512
- constexpr loop iteration per function: 262 144
- constexpr operation count per function: 33 554 432
- template recursion depth: 900 (gcc *might* segfault first)

```
constexpr array<int, 10> fibonacci{[] {
  array<int, 10> a{};
  a[0] = a[1] = 1;
  for (int i = 2; i < 10; i++) a[i] = a[i - 1] + a[i - 2];
  return a;
}()};
static_assert(fibonacci[9] == 55, "CE");

template <typename F, typename INT, INT... S>
constexpr void for_constexpr(integer_sequence<INT, S...>,
                             F &&func) {
  int _[] = {(func(integral_constant<INT, S>{}), 0)...};
}
// example
template <typename... T> void print_tuple(tuple<T...> t) {
  for_constexpr(make_index_sequence<sizeof...(T)>{},
                [&](auto i) { cout << get<i>(t) << '\n'; });
}
```

### 1.2.4. Bump Allocator

```

// global bump allocator
char mem[256 << 20]; // 256 MB
size_t rsp = sizeof mem;
void *operator new(size_t s) {
  assert(s < rsp); // MLE
  return (void *)&mem[rsp -= s];
}
void operator delete(void *) {}

// bump allocator for STL / pbds containers
char mem[256 << 20];
size_t rsp = sizeof mem;
template <typename T> struct bump {
  typedef T value_type;
  bump() {}
  template <typename U> bump(U, ...) {}
  T *allocate(size_t n) {
    rsp -= n * sizeof(T);
    rsp &= 0 - alignof(T);
    return (T *)(mem + rsp);
  }
  void deallocate(T *, size_t n) {}
};
```

## 1.3. Tools

### 1.3.1. Floating Point Binary Search

```
union di {
  double d;
  ull i;
};
bool check(double);
// binary search in [L, R) with relative error 2^-eps
double binary_search(double L, double R, int eps) {
  di l = {L}, r = {R}, m;
  while (r.i - l.i > 1LL << (52 - eps)) {
    m.i = (l.i + r.i) >> 1;
```

```cpp
    if (check(m.d)) r = m;
    else l = m;
  }
  return l.d;
}
```

### 1.3.2. SplitMix64

```cpp
using ull = unsigned long long;
inline ull splitmix64(ull x) {
  // change to `static ull x = SEED;` for DRBG
  ull z = (x += 0x9E3779B97F4A7C15);
  z = (z ^ (z >> 30)) * 0xBF58476D1CE4E5B9;
  z = (z ^ (z >> 27)) * 0x94D049BB133111EB;
  return z ^ (z >> 31);
}
```

### 1.3.3. <random>

```cpp
#ifdef __unix__
random_device rd;
mt19937_64 RNG(rd());
#else
const auto SEED = chrono::high_resolution_clock::now()
                    .time_since_epoch()
                    .count();
mt19937_64 RNG(SEED);
#endif
// random uint_fast64_t: RNG();
// uniform random of type T (int, double, ...) in [l, r]:
// uniform_int_distribution<T> dist(l, r); dist(RNG);
```

### 1.3.4. x86 Stack Hack

```cpp
constexpr size_t size = 200 << 20; // 200MiB
int main() {
  register long rsp asm("rsp");
  char *buf = new char[size];
  asm("movq %0, %%rsp\n" ::"r"(buf + size));
  // do stuff
  asm("movq %0, %%rsp\n" ::"r"(rsp));
  delete[] buf;
}
```

## 1.4. Algorithms

### 1.4.1. Bit Hacks

```cpp
// next permutation of x as a bit sequence
ull next_bits_permutation(ull x) {
  ull c = __builtin_ctzll(x), r = x + (1ULL << c);
  return (r ^ x) >> (c + 2) | r;
}
// iterate over all (proper) subsets of bitset s
void subsets(ull s) {
  for (ull x = s; x;) { --x &= s; /* do stuff */ }
}
```

### 1.4.2. Aliens Trick

```cpp
// min dp[i] value and its i (smallest one)
pll get_dp(int cost);
ll aliens(int k, int l, int r) {
  while (l != r) {
    int m = (l + r) / 2;

    if (s < k) r = m;
    else l = m + 1;
  }
  return get_dp(l).first - l * k;
}
```

### 1.4.3. Hilbert Curve

```cpp
ll hilbert(ll n, int x, int y) {
  ll res = 0;
  for (ll s = n; s /= 2;) {
    int rx = !!(x & s), ry = !!(y & s);

      if (rx == 1) x = s - 1 - x, y = s - 1 - y;
      swap(x, y);
    }
  }
  return res;
}
```

### 1.4.4. Infinite Grid Knight Distance

```cpp
ll get_dist(ll dx, ll dy) {
  if (++(dx = abs(dx)) > ++(dy = abs(dy))) swap(dx, dy);
  if (dx == 1 && dy == 2) return 3;

  ll lb = max(dy / 2, (dx + dy) / 3);
  return ((dx ^ dy ^ lb) & 1) ? ++lb : lb;
}
```

### 1.4.5. Poker Hand

```cpp

using namespace std;

    return make_tuple(type, vf, vs) <
           make_tuple(b.type, b.vf, b.vs);
  }
};
```

### 1.4.6. Longest Increasing Subsequence

```cpp

template <class I> vi lis(const vector<I> &S) {

# 3. Graph

## 3.1. Modeling

- Maximum/Minimum flow with lower bound / Circulation problem
  1. Construct super source $S$ and sink $T$.
  2. For each edge $(x, y, l, u)$, connect $x \to y$ with capacity $u - l$.
  3. For each vertex $v$, denote by $in(v)$ the difference between the sum of incoming lower bounds and the sum of outgoing lower bounds.
  4. If $in(v) > 0$, connect $S \to v$ with capacity $in(v)$, otherwise, connect $v \to T$ with capacity $-in(v)$.
     - To maximize, connect $t \to s$ with capacity $\infty$ (skip this in circulation problem), and let $f$ be the maximum flow from $S$ to $T$. If $f \neq \sum_{v\in V, in(v)>0} in(v)$, there's no solution. Otherwise, the maximum flow from $s$ to $t$ is the answer.
     - To minimize, let $f$ be the maximum flow from $S$ to $T$. Connect $t \to s$ with capacity $\infty$ and let the flow from $S$ to $T$ be $f'$. If $f + f' \neq \sum_{v\in V, in(v)>0} in(v)$, there's no solution. Otherwise, $f'$ is the answer.
  5. The solution of each edge $e$ is $l_e + f_e$, where $f_e$ corresponds to the flow of edge $e$ on the graph.
- Construct minimum vertex cover from maximum matching $M$ on bipartite graph $(X, Y)$
  1. Redirect every edge: $y \to x$ if $(x, y) \in M$, $x \to y$ otherwise.
  2. DFS from unmatched vertices in $X$.
  3. $x \in X$ is chosen iff $x$ is unvisited.
  4. $y \in Y$ is chosen iff $y$ is visited.
- Minimum cost cyclic flow
  1. Consruct super source $S$ and sink $T$
  2. For each edge $(x, y, c)$, connect $x \to y$ with $(cost, cap) = (c, 1)$ if $c > 0$, otherwise connect $y \to x$ with $(cost, cap) = (-c, 1)$
  3. For each edge with $c < 0$, sum these cost as $K$, then increase $d(y)$ by 1, decrease $d(x)$ by 1
  4. For each vertex $v$ with $d(v) > 0$, connect $S \to v$ with $(cost, cap) = (0, d(v))$
  5. For each vertex $v$ with $d(v) < 0$, connect $v \to T$ with $(cost, cap) = (0, -d(v))$
  6. Flow from $S$ to $T$, the answer is the cost of the flow $C + K$
- Maximum density induced subgraph
  1. Binary search on answer, suppose we're checking answer $T$
  2. Construct a max flow model, let $K$ be the sum of all weights
  3. Connect source $s \to v$, $v \in G$ with capacity $K$
  4. For each edge $(u, v, w)$ in $G$, connect $u \to v$ and $v \to u$ with capacity $w$
  5. For $v \in G$, connect it with sink $v \to t$ with capacity $K + 2T - (\sum_{e\in E(v)} w(e)) - 2w(v)$
  6. $T$ is a valid answer if the maximum flow $f < K|V|$
- Minimum weight edge cover
  1. For each $v \in V$ create a copy $v'$, and connect $u' \to v'$ with weight $w(u, v)$.
  2. Connect $v \to v'$ with weight $2\mu(v)$, where $\mu(v)$ is the cost of the cheapest edge incident to $v$.
  3. Find the minimum weight perfect matching on $G'$.
- Project selection problem
  1. If $p_v > 0$, create edge $(s, v)$ with capacity $p_v$; otherwise, create edge $(v, t)$ with capacity $-p_v$.
  2. Create edge $(u, v)$ with capacity $w$ with $w$ being the cost of choosing $u$ without choosing $v$.
  3. The mincut is equivalent to the maximum profit of a subset of projects.
- 0/1 quadratic programming

$$\sum_x c_x x + \sum_y c_y \bar{y} + \sum_{xy} c_{xy} x\bar{y} + \sum_{xyx'y'} c_{xyx'y'}(x\bar{y} + x'\bar{y'})$$

  can be minimized by the mincut of the following graph:
  1. Create edge $(x, t)$ with capacity $c_x$ and create edge $(s, y)$ with capacity $c_y$.
  2. Create edge $(x, y)$ with capacity $c_{xy}$.
  3. Create edge $(x, y)$ and edge $(x', y')$ with capacity $c_{xyx'y'}$.

### 4.2.1. Matroid Intersection

This template assumes 2 weighted matroids of the same type, and that removing an element is much more expensive than checking if one can be added. **Remember to change the implementation details.**

The ground set is $0, 1, \ldots, n-1$, where element $i$ has weight $w[i]$. For the unweighted version, remove weights and change BF/SPFA to BFS.

```cpp
constexpr int N = 100;
constexpr int INF = 1e9;

struct Matroid {       // represents an independent set
  Matroid(bitset<N>);  // initialize from an independent set
  bool can_add(int);   // if adding will break independence
  Matroid remove(int); // removing from the set
};

auto matroid_intersection(int n, const vector<int> &w) {
  bitset<N> S;
  for (int sz = 1; sz <= n; sz++) {
    Matroid M1(S), M2(S);

    vector<vector<pii>> e(n + 2);
    for (int j = 0; j < n; j++)
      if (!S[j]) {
        if (M1.can_add(j)) e[n].emplace_back(j, -w[j]);
        if (M2.can_add(j)) e[j].emplace_back(n + 1, 0);
      }
    for (int i = 0; i < n; i++)
      if (S[i]) {
        Matroid T1 = M1.remove(i), T2 = M2.remove(i);
        for (int j = 0; j < n; j++)
          if (!S[j]) {
            if (T1.can_add(j)) e[i].emplace_back(j, -w[j]);
            if (T2.can_add(j)) e[j].emplace_back(i, w[i]);
          }
      }

    vector<pii> dis(n + 2, {INF, 0});
    vector<int> prev(n + 2, -1);
    dis[n] = {0, 0};
    // change to SPFA for more speed, if necessary
    bool upd = 1;
    while (upd) {
      upd = 0;
      for (int u = 0; u < n + 2; u++)
        for (auto [v, c] : e[u]) {

## 4.4. Theorems

### 4.4.1. Kirchhoff's Theorem

Denote $L$ be a $n \times n$ matrix as the Laplacian matrix of graph $G$, where $L_{ii} = d(i)$, $L_{ij} = -c$ where $c$ is the number of edge $(i, j)$ in $G$.

- The number of undirected spanning in $G$ is $|\det(\tilde{L}_{11})|$.
- The number of directed spanning tree rooted at $r$ in $G$ is $|\det(\tilde{L}_{rr})|$.

### 4.4.2. Tutte's Matrix

Let $D$ be a $n \times n$ matrix, where $d_{ij} = x_{ij}$ ($x_{ij}$ is chosen uniformly at random) if $i < j$ and $(i, j) \in E$, otherwise $d_{ij} = -d_{ji}$. $\frac{rank(D)}{2}$ is the maximum matching on $G$.

### 4.4.3. Cayley's Formula

- Given a degree sequence $d_1, d_2, \ldots, d_n$ for each *labeled* vertices, there are
$$\frac{(n-2)!}{(d_1-1)!(d_2-1)!\cdots(d_n-1)!}$$
spanning trees.
- Let $T_{n,k}$ be the number of *labeled* forests on $n$ vertices with $k$ components, such that vertex $1, 2, \ldots, k$ belong to different components. Then $T_{n,k} = kn^{n-k-1}$.

### 4.4.4. Erdős–Gallai Theorem

A sequence of non-negative integers $d_1 \geq d_2 \geq \ldots \geq d_n$ can be represented as the degree sequence of a finite simple graph on $n$ vertices if and only if $d_1 + d_2 + \ldots + d_n$ is even and

$$\sum_{i=1}^{k} d_i \leq k(k-1) + \sum_{i=k+1}^{n} \min(d_i, k)$$

holds for all $1 \leq k \leq n$.

### 4.4.5. Burnside's Lemma

Let $X$ be a set and $G$ be a group that acts on $X$. For $g \in G$, denote by $X^g$ the elements fixed by $g$:

$$X^g = \{x \in X \mid gx \in X\}$$

Then
$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

## 8. Debug List

```
- Pre-submit:
  - Did you make a typo when copying a template?
  - Test more cases if unsure.
    - Write a naive solution and check small cases.
  - Submit the correct file.

- General Debugging:
  - Read the whole problem again.
  - Have a teammate read the problem.
  - Have a teammate read your code.
    - Explain you solution to them (or a rubber duck).
  - Print the code and its output / debug output.
  - Go to the toilet.

- Wrong Answer:
  - Any possible overflows?
    - > `__int128` ?
    - Try `-ftrapv` or `#pragma GCC optimize("trapv")`
  - Floating point errors?
    - > `long double` ?
    - turn off math optimizations
    - check for `==`, `>=`, `acos(1.000000001)`, etc.
  - Did you forget to sort or unique?
  - Generate large and worst "corner" cases.
  - Check your `m` / `n`, `i` / `j` and `x` / `y`.
  - Are everything initialized or reset properly?
  - Are you sure about the STL thing you are using?
    - Read cppreference (should be available).
  - Print everything and run it on pen and paper.

- Time Limit Exceeded:
  - Calculate your time complexity again.
  - Does the program actually end?
    - Check for `while(q.size())` etc.
  - Test the largest cases locally.
  - Did you do unnecessary stuff?
    - e.g. pass vectors by value
    - e.g. `memset` for every test case
  - Is your constant factor reasonable?

- Runtime Error:
  - Check memory usage.
    - Forget to clear or destroy stuff?
    - > `vector::shrink_to_fit()`
  - Stack overflow?
  - Bad pointer / array access?
    - Try `-fsanitize=address`
  - Division by zero? NaN's?
```
